

# ABSTRACT OF THE DISCLOSURE

A surface acoustic wave device which utilizes excitation of a shear horizontal wave includes a piezoelectric substrate and an interdigital transducer provided on the piezoelectric substrate. The interdigital transducer includes at least three metal layers containing at least one first layer made of a metal with a density of approximately  $15 \text{ g/cm}^3$  or more as a major component and at least one second layer made of a metal with a density of about  $12 \text{ g/cm}^3$  or less. The volume of the first layer being in the range from about 20% to about 95% of the total volume of the interdigital transducer or the reflector.
